End-to-End Workflow for C-Square Seller → Non-C-Square Buyer → eMandate Collection Platform

---

🧭 Project Purpose

This platform is designed to bridge the gap between:

- Sellers using C-Square ERP
- Buyers who are outside the ERP ecosystem
- Automated payment collection using eMandate
- Banking/payment infrastructure through Easebuzz and NPCI

The platform enables sellers to digitally collect payments from non-C-Square buyers using a secure onboarding and eMandate flow.

🎯 Problem Statement

Today, sellers using ERP systems face a major issue:

Invoice exists inside ERP

↓

Buyer exists outside ERP

↓

Payment collection becomes manual

Current manual process includes:

- 📞 Phone follow-ups
- 📄 Cheque collection
- 📧 Payment reminders
- ⏳ Delayed settlements
- ❌ Lack of payment visibility
- ❌ No automated collection process

💡 Proposed Solution

A middleware platform built under GIROPie logic that acts as a collection bridge.

This platform connects:

Seller ERP → Buyer Portal → eMandate → Payment Processing → ERP Update

The system allows:

- Sellers to initiate payment collection
- Buyers to authorize automated payment
- Platform to manage payment lifecycle
- ERP to remain continuously updated

ERP Feedback Layer

🧩 **Core Actors Involved**

🏢 **Seller**

The business that uses C-Square ERP.

Example:

- Pen Manufacturer
- Distributor
- Pharma Seller

- Wholesaler

🛒 **Buyer**

The customer who purchases goods but does not use ERP.

Example:

- Retailer
- Stationery Shop
- Local Distributor

🖥️ **C-Square ERP**

Responsible for:

- Invoice creation
- Seller management
- Data export to platform

⚙️ **Your Platform**

Acts as:

- Buyer onboarding layer
- Invoice relationship manager
- eMandate workflow controller
- Payment orchestration engine
- ERP synchronization system

💳 **Easebuzz**

Responsible for:

- Payment gateway connection
- Mandate processing
- Banking communication
- Debit execution

🏦 **NPCI / Bank**

Responsible for:

- Validating mandates
- Bank authorization
- Generating UMRN
- Processing debit requests

🚀 **Full End-to-End Workflow**

PART 1 — Seller Side Flow

✅ **Step 1 — Seller Creates Invoice**

Seller uses C-Square ERP to generate invoice.

Example:

Seller = Pen Manufacturer

Buyer = Retailer A

Amount = ₹1,00,000

Due Date = 20 May

Invoice ID = INV1001

At this stage:

- Invoice exists inside ERP
- Buyer still has no access
- No payment process started

✅ **Step 2 — Seller Clicks "Collect Payment"**

Inside ERP, seller chooses:

Collect Payment

This action starts communication with your platform.

✅ Step 3 — ERP Sends Invoice Data To Platform

ERP sends invoice details using API.

Transferred data:

- Seller information
- Buyer information
- Buyer contact details
- Invoice amount
- Due date
- Invoice number
- Optional KYC details

✅ Step 4 — Platform Creates Internal Mapping

Your platform creates database relationships.

Platform stores:

Seller Profile

Seller ID = S101

Buyer Placeholder

Buyer may not yet be registered.

Buyer ID = B501

Invoice Mapping

Invoice ID = INV1001

Request Record

Request ID = REQ9001

🔗 Relationship Creation

This is one of the most important backend concepts.

Your platform creates:

Buyer ↔ Seller ↔ Invoice

This relationship allows platform to recognize buyer later.

✅ Step 5 — Platform Generates Secure Link

Platform generates buyer-facing URL.

Example:

pay.platform.com/request/REQ9001

✅ Step 6 — Buyer Receives Message

Message may be sent through:

- 📱 SMS
- 💬 WhatsApp
- 📧 Email

Example message:

ABC Pen Manufacturer has requested payment authorization for pending invoice.

⚠️ Important Clarification

The message itself does NOT contain invoice data.

Message only contains:

Request Reference Link

Actual invoice data is securely stored inside platform database.

PART 2 — Buyer Side Flow

✅ Step 7 — Buyer Opens Link

Buyer clicks received link.

Buyer lands on platform portal.

✅ Step 8 — Platform Reads Request ID

Example:

REQ9001

Platform uses this ID to fetch stored invoice information.

✅ Step 9 — Buyer Sees Invoice Summary

Buyer sees:

- Seller name
- Outstanding amount
- Due date
- Pending invoices

Example:

ABC Pen Manufacturer

₹1,00,000 pending

Due Date: 20 May

✅ Step 10 — Buyer Login / Signup

Buyer enters:

- Mobile number
- OTP verification

Buyer account gets activated.

✅ Step 11 — Platform Recognizes Buyer

Platform matches:

Buyer Mobile Number

against previously stored buyer record.

Example:

Mobile = 9876543210

Matched to:

Buyer ID = B501

🔍 How Platform Recognizes Buyer

Seller already shared buyer information earlier.

Therefore platform knows:

Buyer Identity → Related Seller → Related Invoices

✅ Step 12 — Buyer Dashboard Loads

Buyer sees all pending invoices.

Grouped seller-wise.

Example:

ABC Manufacturer

Invoice 1 → ₹30,000

Invoice 2 → ₹70,000

XYZ Distributor

Invoice → ₹25,000

PART 3 — Payment Agreement Layer

✅ Step 13 — Buyer Chooses Payment Model

Platform provides flexible options.

Option 1 — Full Payment

One-time debit

Option 2 — Split Payment

Example:

₹50,000 now

₹50,000 later

Option 3 — Extension Request

Buyer may request extended payment date.

Option 4 — eMandate Auto Debit

Buyer authorizes future automated payment.

PART 4 — eMandate Creation Flow

✅ Step 14 — Buyer Selects Auto Payment

Buyer clicks:

Approve Auto Debit

✅ Step 15 — Buyer Enters Bank Details

Buyer enters:

- Account holder name
- Account number
- IFSC code
- Bank name
- Consent approval

⚠️ Important Clarification

Entering bank details does NOT create mandate.

It only starts mandate request process.

✅ Step 16 — Platform Sends Mandate Request

Your platform sends API request to:

entity["company","Easebuzz","Indian payment gateway and recurring payment platform"]

Payload includes:

- Buyer information
- Bank details
- Invoice reference
- Seller reference
- Amount limits
- Due date
- Consent information

✅ Step 17 — Easebuzz Connects To NPCI

entity["organization","National Payments Corporation of India","NPCI India payments organization"] validates mandate request.

NPCI communicates with customer bank.

✅ Step 18 — Bank Verification

Bank validates:

- Customer exists
- Account valid
- Consent approved
- Mandate allowed

✅ Step 19 — UMRN Generated

UMRN = Unique Mandate Reference Number.

Example:

UMRN123456789

This becomes official banking authorization.

✅ Step 20 — Platform Receives Approval

Easebuzz sends response.

Platform receives:

- UMRN
- Approval status
- Bank confirmation
- Timestamp

✅ Step 21 — ERP Gets Updated

ERP receives:

Mandate Approved

UMRN Created

Buyer Authorized

Seller dashboard now reflects mandate approval.

PART 5 — Payment Execution Flow

✅ Step 22 — System Waits Until Due Date

Mandate approval does NOT debit immediately.

Mandate only gives permission.

✅ Step 23 — Platform Scheduler Runs

Daily scheduler checks:

Which invoices are due today?

✅ Step 24 — Platform Performs Validation

Before debit, system validates:

- Invoice still active
- Buyer not disputed
- Payment not already done
- Split payment logic
- Extension logic
- Mandate still active

✅ Step 25 — Platform Sends Debit Request

Platform instructs:

entity["company","Easebuzz","Indian payment gateway and recurring payment platform"]

Example:

Debit ₹1,00,000 using UMRN

✅ Step 26 — Easebuzz Processes Debit

Easebuzz communicates with:

- NPCI
- Bank / Debit request executed.

✅ Step 27 — Buyer Account Debited

If balance exists:

Payment Successful

✅ Step 28 — Settlement Happens

Money moves:

Buyer Bank → Seller Settlement

✅ Step 29 — UTR Generated

UTR = Unique Transaction Reference.

Example:

UTR99887766

✅ Step 30 — Callback Sent To Platform

Easebuzz returns:

- Payment status
- UTR
- Debit timestamp
- Success/failure

✅ Step 31 — Platform Updates Invoice Status

Invoice changes to:

Paid

✅ Step 32 — ERP Updated Again

ERP receives:

- Payment completed
- UTR
- Settlement date
- Paid amount

📊 Dashboard Visibility

Seller Dashboard

Seller sees:

- Buyer status
- Mandate approval
- Pending invoices
- Paid invoices
- UTR details
- Collection status
- Failed debit attempts

Buyer Dashboard

Buyer sees:

- Seller-wise invoices
- Pending payments
- Paid history
- Mandate status
- Upcoming debits
- Extension requests

🔗 Core Platform Relationships

Buyer ↔ Seller

Defines payment relationship.

Buyer ↔ Invoice

Tracks dues.

Buyer ↔ Mandate

Tracks payment authorization.

Seller ↔ Invoice

Tracks collection lifecycle.

END
